

1 Basic tests

Theorem 1.1. *Case 1: Environment ends with simple text.*

♡

Theorem 1.2. *Case 2: Environment ends with display*

$$1 + 1 = 2.$$

♡

Theorem 1.3. *Case 3: Environment ends with equationlike (numbered)*

(1) $1 + 1 = 2.$

♡

Theorem 1.4. *Case 4: Environment ends with*

- *a*
- *list.*

♡

2 Other simple tests

These test multiple or nested boxes inside of theoremlike environments.

Remark 2.1. Case 1: Environment ends with simple text. But first there is an equation

(2) $1 + 1 = 2$

and then the simple text.

◇

Remark 2.2. Case 2: Environment ends with display

1. but first
2. a list

$$1 + 1 = 2.$$

◇

Remark 2.3. Case 3: Environment ends with align following

- a
- list

and

`display math`
`again`

(3) $x = 2$

(4) $y = 3.$ this is a very wide box that uses many words to fill the line ◇

Remark 2.4. Case 4: Environment ends with

- a
- list.
- that is nested
 1. inside another
 2. list

◇

Note 2.1. Case 4: Environment ends with

- a
- list
- with a display
 1. and there is
 2. a nested list
- but the outer list has
- the final item

$$a^2 + b^2 = c^2$$

•

Note 2.2.

- a
- list
 1. and there is
 2. a nested list
 3. with a display

$$a^2 + b^2 = c^2$$

•

Note 2.3.

- a
- list
 1. and there is
 2. a nested list
 3. with align

(5)

$$a^2 + b^2 = c^2$$

(6)

$$3^2 + 4^2 = 5^2$$

•

Note 2.4.

- a
- list
 1. and there is
 2. a nested list
 3. with align

$$(7) \qquad a^2 + b^2 = c^2$$

$$(8) \qquad 3^2 + 4^2 = 5^2$$

Then there is some text at the end

Note 2.5. First an align

$$(9) \qquad a^2 + b^2 = c^2$$

$$(10) \qquad 3^2 + 4^2 = 5^2$$

Then some text,

1. and then
2. a list.

3 some other messy tests

Theorem 3.1. *regular text*

Theorem 3.2. *This ends in a display*

$$3^2 + 4^2 = 5^2.$$

Theorem 3.3. *This ends in a display*

$$3^2 + 4^2 = 5^2$$

4 Comprehensive test of endmarkable environments

[in progress] This section aims to have one simple example for every possible environment that could be endmarked, so that we can confirm support.

Subsections are intended to group environment types according to how they are handled internally; revise as necessary.

Many of the examples and descriptions are from the amsmath documentation: Section 3, Displayed equations.

4.1 equationlike

These environments are full line width. They do not use horizontal alignment markers (&).

Test 4.1. equation: a single equation with an automatically generated number

$$(15) \qquad \int_a^b f(x) dx \qquad \diamond$$

Test 4.2. equation*: unnumbered variant

$$\int_a^b f(x) dx \qquad \diamond$$

Test 4.3. [. . .]: The classic display math. Internally, amsmath redefines this as equation*

$$\int_a^b f(x) dx \qquad \diamond$$

Test 4.4. \$\$..\$\$: People still use this, but maybe we don't want to support it. By default, it doesn't work well with `qedhere` (end mark not pushed to end of line).

$$\int_a^b f(x) dx \qquad \diamond$$

Test 4.5. multiline: a variation of equation, for long equations with linebreaks. The first line is aligned left, middle lines are centered, last line is aligned right. Equation number is on the first line.

$$(16) \quad \begin{array}{l} a + b + c + d + e + f + a + b + c + d + e + f \\ \quad + g + h + g + h + g + h + \\ \quad + i + j + k + l + m + n + i + j + k + l + m + n \end{array} \quad \diamond$$

Test 4.6. `multline*`: unnumbered variant

$$\begin{aligned} a + b + c + d + e + f + a + b + c + d + e + f \\ + g + h + g + h + g + h + \\ + i + j + k + l + m + n + i + j + k + l + m + n \quad \diamond \end{aligned}$$

Test 4.7. `gather`: a group of numbered equations with no horizontal alignment; each line is horizontally centered.

$$\begin{aligned} (17) \quad & \int_a^b f(x) dx \\ (18) \quad & \int_a^b f(x)g(x)h(x) dx \quad \diamond \end{aligned}$$

Note: currently `gather` is handled the same way as `align`. It's unclear (to me, NGJ) whether it should be grouped with the other “alignlike” environments for that reason.

Test 4.8. `gather*`: unnumbered variant

$$\begin{aligned} & \int_a^b f(x) dx \\ & \int_a^b f(x)g(x)h(x) dx \quad \diamond \end{aligned}$$

Test 4.9. `displaymath`: This is an older environment, not one of the `amsmath` ones; the `ams` doc says it's functionally equivalent to `equation*`

$$\int_a^b f(x) dx \quad \diamond$$

4.2 alignlike

These environments are full line width. They use horizontal alignment markers (&).

Test 4.10. `align`: for two or more equations; this test has just one alignment column

$$\begin{aligned} (19) \quad & \int_a^b f(x) dx = 1 \\ (20) \quad & \int_a^b g(x) + h(x) dx = a + b + c \quad \diamond \end{aligned}$$

Test 4.11. align: another test, with multiple alignment columns

$$(21) \quad \int_a^b f(x) dx = 1 \qquad x = y + z \qquad p = 0$$

$$(22) \quad \int_a^b g(x) + h(x) dx = a + b + c \qquad x' + y' = z' \qquad q = 1 \quad \diamond$$

Test 4.12. align*: unnumbered variant; one column

$$\int_a^b f(x) dx = 1$$

$$\int_a^b g(x) + h(x) dx = a + b + c \quad \diamond$$

Test 4.13. align*: unnumbered variant; multiple columns

$$\int_a^b f(x) dx = 1 \qquad x = y + z \qquad p = 0$$

$$\int_a^b g(x) + h(x) dx = a + b + c \qquad x' + y' = z' \qquad q = 1 \quad \diamond$$

Test 4.14. alignat: allows the horizontal space between equations to be explicitly specified; takes an argument for number of “equation columns”.

$$(23) \quad x = y_1 - y_2 + y_3 - y_5 + y_8 - \dots \quad \text{by (C)}$$

$$(24) \quad = y' \circ y^* \quad \text{by (D)}$$

$$(25) \quad = y(0)y' \quad \text{by Axiom 1.} \quad \diamond$$

Test 4.15. alignat*: unnumbered variant

$$x = y_1 - y_2 + y_3 - y_5 + y_8 - \dots \quad \text{by (C)}$$

$$= y' \circ y^* \quad \text{by (D)}$$

$$= y(0)y' \quad \text{by Axiom 1.} \quad \diamond$$

Test 4.16. flalign: full length alignment; stretches to fill line, leaving space for equation numbers and endmark (if present)

$$(26) \quad x = y \qquad X = Y$$

$$(27) \quad x' = y' \qquad X' = Y'$$

$$(28) \quad x + x' = y + y' \qquad X + X' = Y + Y' \quad \diamond$$

Test 4.17. flalign*: unnumbered variant

$$x = y \qquad X = Y$$

$$x' = y' \qquad X' = Y'$$

$$x + x' = y + y' \qquad X + X' = Y + Y' \quad \diamond$$

4.3 inner math environments

These environments go inside other displayed math environments.

Note: Maybe these should all be moved to the “unsupported” section, and their endmarks can be handled by the surrounding environments.

Test 4.18. `split`: for a *single* equation split among multiple lines, like `multiline`, but with some alignment points.

This `split` is inside `equation`.

$$(29) \quad H_c = \frac{1}{2n} \sum_{l=0}^n (-1)^l (n-l)^{p-2} \sum_{l_1+\dots+l_p=l} \prod_{i=1}^p \binom{n_i}{l_i} \cdot [(n-l) - (n_i - l_i)]^{n_i - l_i} \cdot \left[(n-l)^2 - \sum_{j=1}^p (n_i - l_i)^2 \right].$$

Note: The endmark is missing from the previous example, but not the next one. This seems like a bug.

Test 4.19. `split`: This `split` is inside `gather`.

$$(30) \quad H_c = \frac{1}{2n} \sum_{l=0}^n (-1)^l (n-l)^{p-2} \sum_{l_1+\dots+l_p=l} \prod_{i=1}^p \binom{n_i}{l_i} \cdot [(n-l) - (n_i - l_i)]^{n_i - l_i} \cdot \left[(n-l)^2 - \sum_{j=1}^p (n_i - l_i)^2 \right]. \quad \diamond$$

The width of the following environments is just the width of the content. Therefore, maybe they should *not* be endmarkable? (I’m not sure.) Note: there are options to set their vertical alignment; maybe that is useful?

Each of these is inside `equation`. Each takes an optional argument for vertical positioning (baseline); demonstrated just with the first one.

Test 4.20. `gathered`: [c] (the default)

$$(31) \quad \begin{array}{c} \int_a^b f(x) dx \\ \int_a^b f(x) dx \\ \int_a^b f(x) dx \\ a + b + c + d = e + f + g + h + i + j + k \end{array} \quad \diamond$$

Test 4.21. gathered: [t] (baseline top)

$$\begin{aligned}
 (32) \quad & \int_a^b f(x) \, dx && \diamond \\
 & \int_a^b f(x) \, dx \\
 & \int_a^b f(x) \, dx \\
 & a + b + c + d = e + f + g + h + i + j + k
 \end{aligned}$$

Test 4.22. gathered: [b] (baseline bottom)

$$\begin{aligned}
 (33) \quad & \int_a^b f(x) \, dx \\
 & \int_a^b f(x) \, dx \\
 & \int_a^b f(x) \, dx \\
 & a + b + c + d = e + f + g + h + i + j + k && \diamond
 \end{aligned}$$

Test 4.23. aligned:

$$\begin{aligned}
 (34) \quad & \int_a^b f(x) \, dx = 2 \\
 & \int_a^b f(x) \, dx = x + y + z && \diamond \\
 & \int_a^b f(x) \, dx = 1 \\
 & a + b + c + d = e + f + g + h + i + j + k
 \end{aligned}$$

Test 4.24. alignedat:

$$\begin{aligned}
 (35) \quad & x = y_1 - y_2 + y_3 - y_5 + y_8 - \dots && \text{by (C)} \\
 & = y' \circ y^* && \text{by (D)} && \diamond \\
 & = y(0)y' && \text{by Axiom 1.}
 \end{aligned}$$

Test 4.25. cases:

$$P_{r-j} = \begin{cases} 0 & \text{if } r-j \text{ is odd,} \\ r!(-1)^{(r-j)/2} & \text{if } r-j \text{ is even.} \end{cases} \quad \diamond$$

Test 4.26. dcases: This is a variant that the amsdocs mention, but is provided by the `mathtools` package. It makes the case lines `displaystyle` instead of (the default) `textstyle`. So, maybe we don't want to support this directly (especially not if we decide not to make `cases` endmarkable in the first place).
[no example here] $\diamond$

4.4 lists

Test 4.27. enumerate: items are counted

1. top
 2. middle
 3. bottom
- ◇

Test 4.28. itemize: items are not counted

- top
 - middle
 - bottom
- ◇

Test 4.29. description: items have labels

The first one: goes here

Another: and this is the item content

The final one: these are often used for definitions

◇

Test 4.30. list: This is the basic environment that others are derived from. Adding thmmark support for this might either (a) automatically give it to other lists or (b) make us confused because other environments use **list** in subtle ways (e.g., **trivlists**).

Update: I've added this, and it's fine; it doesn't change the others. Furthermore, the hooks still have to be added for **itemize**, **enumerate**, and **description**; it's not enough to just set the hooks for **list**.

first

middle

last

◇

4.5 text blocks

(todo: quote, verbatim, other trivlist?)

Test 4.31. quote:

A quotation goes here. *As any dedicated reader can clearly see, the Ideal of practical reason is a representation of, as far as I know, the things in themselves; as I have shown elsewhere, the phenomena should only be used as a canon for our understanding. The paralogisms of practical reason are what first give rise to the architectonic of practical reason.*

◇

verbatim

Currently this only sort of works. The `\end{verbatim}` must be separated by a space, but not a newline, from the contents. This could have to do with the `hmode` v.s. `vmode` checks in the `thmmark` code.

Test 4.32. verbatim: Note that linebreaks are also treated verbatim.

Some verbatim symbols \ & \$ etc.

More verbatim symbols \ & \$ etc. More verbatim symbols \ & \$ etc. More verbatim symbols \ &
(The previous line intentionally runs off the page) ◇

Test 4.33. verbatim: (Another test) If the last line is *just a little* too long, it will push the endmark into the margin.

A123456789.B123456789.C123456789.D123456789.E123456789.F123456789 ◇

Test 4.34. verbatim: (Another test) If the last line is *a little more* too long, it will push the endmark down.

A123456789.B123456789.C123456789.D123456789.E123456789.F123456789.
◇

Test 4.35. center: center the contents

some centered text, or equation, or other environment environment environme
◇

Test 4.36. center: center the contents

some centered text, or equation, or other environment environment
environment ◇
environment

4.6 tablelike

See source2e: File 41 ltab.dtx: Tabbing, Tabular, and Array Environments.

Explanation and examples from <https://latexref.xyz>.

Test 4.37. tabbing: manually set and use tab stops

row1-col1 row1-col2 this one has a longer heading r1-c4
row2-col1 row2-col3 .
r3-c1 next field a b ◇

Test 4.38. tabbing: manually set and use tab stops

row1-col1 row1-col2 this one has a longer heading r1-c4
row2-col1 row2-col3 .
r3-c1 next field a this one has a longer heading
◇

4.7 unsupported

These environments are intentionally unsupported. The marks may or may not be placed as expected, depending on the surrounding environment(s).

Test 4.39. tabular: a table; wrap in another environment to position endmark

<i>Player name</i>	<i>Career home runs</i>	
Hank Aaron	755	
Babe Ruth	714	◇
Hank Aaron (repeat)	755	
Babe Ruth (repeat)	714	

Test 4.40. tabular: a table in a `center`, with `\qedabove` to manually position the endmark

<i>Player name</i>	<i>Career home runs</i>	
Hank Aaron	755	
Babe Ruth	714	
Hank Aaron (repeat)	755	
Babe Ruth (repeat)	714	◇

Note: `\qedabove` can mess up spacing of the following lines, such as this one. *As any dedicated reader can clearly see, the Ideal of practical reason is a representation of, as far as I know, the things in themselves; as I have shown elsewhere, the phenomena should only be used as a canon for our understanding. The paralogisms of practical reason are what first give rise to the architectonic of practical reason.*

Test 4.41. eqnarray: not recommended, for many reasons documented in Avoid `eqnarray`! (TUGboat 33:1, 2012)

$$(36) \quad \int_a^b f(x) dx = 1. \quad \diamond$$

Test 4.42. pmatrix: other matrix environments are likewise not (directly) supported: `smallmatrix`, `bmatrix`, `Bmatrix`, `vmatrix`, and `Vmatrix`. Just let the surrounding environment handle the end mark.

$$\begin{pmatrix} a & b \\ c & d \end{pmatrix} \quad \diamond$$

Test 4.43. array: works inside displayed math; this one is in equation*. Just let the surrounding environment handle the end mark.

$$\chi(x) = \begin{vmatrix} x-a & -b & -c \\ -d & x-e & -f \\ -g & -h & x-i \end{vmatrix} \quad \diamond$$

tikz environments

If these are wrapped in other environments like **equation**, then they won't need direct support

Test 4.44. `tikzpicture`: often used for diagrams, but of course requires `tikz`

Test 4.45. `tikzcd`: another popular one, also requires extra packages
This is a `tikzcd` inside an `equation`.

(37)

$$\begin{array}{ccc} A & \xrightarrow{\phi} & B \\ \downarrow & & \downarrow \psi \\ C & \xrightarrow{\eta} & D \end{array}$$

A commutative diagram with nodes A, B, C, and D. A is at the top left, B at the top right, C at the bottom left, and D at the bottom right. There is a horizontal arrow from A to B labeled with the Greek letter phi (φ). There is a horizontal arrow from C to D labeled with the Greek letter eta (η). There is a vertical arrow from A down to C. There is a vertical arrow from B down to D labeled with the Greek letter psi (ψ).

5 Other Tests

Here are tests of two things:

1. a command to disable the thmmark for one box
2. a command to put the thmmark on a previous line

Test 5.1. Use `\par` and negative `\vspace` to manually set endmark at bottom of environment. Note: This will cause overlap with content, if the previous line is too long, so it should only be placed manually.

$$\chi(x) = \left| \begin{array}{ccc} x-a & -b & -c \\ -d & x-e & -f \\ -g & -h & x-i \end{array} \right| \quad \diamond$$

Paragraph after environment, to check spacing. *Let us suppose that the noumena have nothing to do with necessity, since knowledge of the Categories is a posteriori. Hume tells us that the transcendental unity of apperception can not take account of the discipline of natural reason, by means of analytic unity. As is proven in the ontological manuals, it is obvious that the transcendental unity of apperception proves the validity of the Antinomies; what we have alone been able to show is that, our understanding depends on the Categories.*

Test 5.2. (duplicate, with no extra commands, to check spacing)

$$\chi(x) = \left| \begin{array}{ccc} x-a & -b & -c \\ -d & x-e & -f \\ -g & -h & x-i \end{array} \right| \quad \diamond$$

Paragraph after environment, to check spacing. *Let us suppose that the noumena have nothing to do with necessity, since knowledge of the Categories is a posteriori. Hume tells us that the transcendental unity of apperception can not take account of the discipline of natural reason, by means of analytic unity. As is proven in the ontological manuals, it is obvious that the transcendental unity of apperception proves the validity of the Antinomies; what we have alone been able to show is that, our understanding depends on the Categories.*

Test 5.3. `\noqed` does not work here, at all

$$(38) \quad x = 2$$

$$(39) \quad y = 3$$

$$(40) \quad P_{r-j} = \begin{cases} 0 & \text{if } r-j \text{ is odd,} \\ r!(-1)^{(r-j)/2} & \text{if } r-j \text{ is even} \\ \text{other} & \text{case, for testing.} \end{cases}$$

a line of text ◇

Test 5.4. `\noqed` does not work here

$$(41) \quad x = 2$$

$$(42) \quad y = 3 \quad \diamond$$

5.1 tikzpicture

Some tests of `tikzpicture` in equations. This is how I (NGJ) often make numbered commutative diagrams.

Test 5.5. `tikzpicture` in equation
baseline (0,0)

(43)

Test 5.6. another `tikzpicture` in equation
baseline (1,1)

(44)

Test 5.7. another `tikzpicture` in equation
baseline (1,1); use `\par` and negative `\vspace` to reposition endmark

(45)

6 align and friends with tall lines

Test 6.1. align: with cases

(46) words to push this content to the right edge $x = 2$

(47)
$$y = \begin{cases} \int_a^b f(x) dx \\ \int_a^b f(x) dx \\ \int_a^b f(x) dx \\ \int_a^b f(x) dx \end{cases} \diamond$$

Spacing test. *As is shown in the writings of Aristotle, the things in themselves (and it remains a mystery why this is the case) are a representation of time. Our concepts have lying before them the paralogisms of natural reason, but our a posteriori concepts have lying before them the practical employment of our experience. Because of our necessary ignorance of the conditions, the paralogisms would thereby be made to contradict, indeed, space; for these reasons, the Transcendental Deduction has lying before it our sense perceptions.*

Test 6.2. Similar to above, but manually reposition endmark with
`\par\vspace{-1.6\baselineskip}~`
after `\end{align}`

(48) words to push this content to the right edge $x = 2$

(49)
$$y = \begin{cases} \int_a^b f(x) dx \\ \int_a^b f(x) dx \\ \int_a^b f(x) dx \\ \int_a^b f(x) dx \end{cases} \diamond$$

What if there is another line of text? Is the endmark placed above?

Spacing test. *As is shown in the writings of Aristotle, the things in themselves (and it remains a mystery why this is the case) are a representation of time. Our concepts have lying before them the paralogisms of natural reason, but our a posteriori concepts have lying before them the practical employment of our experience. Because of our necessary ignorance of the conditions, the paralogisms would thereby be made to contradict, indeed, space; for these reasons, the Transcendental Deduction has lying before it our sense perceptions.*

Notes for the previous example.

1. Ending with `\qedabove` also works.
2. Ending with `\qedhere` doesn't work; the endmark is on the baseline.

3. Ending with `\qedhere` (as in `\qedprev`) followed by `\hspace` *does* work; the endmark appears after the fourth `cases` row.
It doesn't matter how much `hspace`, as long as it's a nonzero amount. This is probably something to do with `vmode` v.s. `hmode`, and if so then there is probably a better way to handle it. That's beyond what I currently understand though.
4. Spacing after the environment doesn't seem to be affected by the negative `vspace`, but lines *inside* the environment are affected.
5. Maybe the whole negative `vspace` idea is just not great; is there a better alternative?
